SUMMARY

Engineering candidate with internship experience in data analysis and machine learning. Brings a disciplined and organized approach to work, emphasizing consistency, punctuality, and clear communication. Interested in building a career in data-driven and technology-focused fields, with a growing interest in artificial intelligence and practical industry applications.

EDUCATION

B.Sc. in Computer Engineering Oct 2021 – Feb 2027 (Expected)
Marmara University, Faculty of Engineering
GPA: 3.01/4.00

EXPERIENCE

IT Intern Jul 2026 – Sep 2026
Ferro Döküm
- Developed a Streamlit-based EDI order analysis dashboard using Python and Pandas to process large-scale Excel data, including order revision tracking, demand analysis, material level comparisons, KPI monitoring, and trend analysis.
- Developed data-driven production shift planning solutions by incorporating operational constraints into planning workflows and explored AI-assisted decision support using Microsoft Copilot.
- Worked with UiPath and existing RPA workflows to support process automation activities within the IT department.

Data Science Intern Jul 2025 – Aug 2025
Summarify
- Contributed to early project stages by performing data preprocessing and feature engineering tasks.
- Applied feature selection techniques to support initial model comparisons and improve variable understanding.
- Implemented RAG concepts to develop prototype generative AI capabilities.

Research Intern Jul 2024 – Aug 2024
VeNIT Lab
- Processed and structured OpenStreetMap spatial datasets to build customized visualizations for route analysis.
- Implemented the A-star routing algorithm to calculate optimal pathing across spatial network data.
- Configured virtual development environments and structured raw datasets to streamline team research workflows.

PROJECTS

ISA-Aware Hardware–Software Co-Design of a Lightweight ML Accelerator
- Analyzed ML workloads at the assembly level and investigated ISA-level optimizations for key ML operations
- Explored software-side optimization techniques including low-bit quantization, weight packing, vectorization, and inline assembly to improve computational efficiency.

Dockerized Boat Price Predictor
- Developed a LightGBM boat price regression model with feature engineering and Optuna-based hyperparameter optimization.
- Integrated the model into a Streamlit application and deployed it using Docker and AWS EC2.

Customer Churn Prediction App
- Developed an interactive Streamlit application using XGBoost to predict customer churn and display prediction probabilities.
- Performed exploratory data analysis and feature engineering to prepare customer data for model inference.

TECHNICAL SKILLS

Programming: Python, C, SQL
Visualization & Analytics: Excel, Power BI, Pandas, Seaborn, Plotly
Machine Learning: Scikit-learn, PyTorch, Optuna
GenAI & LLM Tools: LangChain, LangGraph, Ollama
Tools & Deployment: Git, GitHub, Docker, AWS, UiPath

LANGUAGES

Turkish (Native)
English (Full Professional Proficiency)
Spanish (Beginner)

PERSONAL INTERESTS

Animated films and series | Tango | Novels and philosophy books | Collecting toy figures | Model building
